1. Introduction**1.1 Introduction**

This Site Delineation Report and Removal Action Work Plan has been prepared by ARCADIS on behalf of ExxonMobil Environmental Services Company (EMES) to present the results of the activities performed for site delineation and describes the removal action to address the arsenic- and lead- impacted media at the former Virginia-Carolina Chemical Corporation (VCC) phosphate/fertilizer plant located in Atlanta, DeKalb County, Georgia (the Site). Figure 1-1 identifies the Site location on the U.S. Geological Survey (USGS) 7.5-minute quadrangle for Northeast Atlanta, Georgia.

Unless otherwise specified in this report, the site delineation activities described herein were performed in accordance with the United States Environmental Protection Agency- (USEPA-) approved *Site Delineation Work Plan, Former Virginia-Carolina Chemical Corporation Site, Atlanta, DeKalb County, Georgia (Work Plan)* (ARCADIS, 2008).

1.2 Project Objectives

The objective of the site delineation activities was to evaluate and refine the magnitude and extent of arsenic and lead concentrations previously detected in soil and groundwater at the Site. These data, in conjunction with data obtained during the Preliminary Assessment/Site Inspection investigation conducted in 2006 (BBL, 2007), were used to develop an appropriate removal action strategy for the Site that is protective of both human health and the environment. This report summarizes the cumulative data collected and the proposed removal action strategy.

1.3 Site Description and Background**1.3.1 Former Facility Description**

The former VCC plant in Atlanta, Georgia was established by Virginia-Carolina Chemical Company near the turn of the 20th Century through the acquisition of three facilities: the former Virginia-Carolina Chemical Company Fertilizer Works facility; the former Clifton Chemical and Phosphate Company plant facility; and the former Kennesaw Plant facility. Prior to acquisition by Virginia-Carolina Chemical Company, all three of these facilities produced sulfuric acid using the lead acid chamber process. However, following acquisition by Virginia-Carolina Chemical Company, it appears that

fertilizer manufacturing and acid production operations were eventually consolidated into the former VCC Fertilizer Works located in the northwestern portion of the Site (Figure 1-2). The Clifton Chemical and Phosphate Company facility was out of operation by 1892, and in ruins by 1899 before being acquired by VCC. The Kennesaw Guano Company operated a complete fertilizer plant with a lead acid chamber structure until at least 1899, but by 1911 the lead acid chamber structure was removed, and Virginia-Carolina Chemical Company was using the former mill and dumping pit for fertilizer storage.

Virginia-Carolina Chemical Company entered into bankruptcy in 1924. At the conclusion of federal reorganization proceedings in 1926, VCC of Richmond, Virginia emerged as a new company and acquired the former Virginia-Carolina Chemical Company phosphate fertilizer operations in Atlanta, DeKalb County, Georgia. VCC began selling its DeKalb County properties starting in 1938, and in 1961, VCC sold its remaining property to the City of Atlanta, which included the site of the VCC Fertilizer Works. In 1963, VCC merged into Socony Mobil Oil; the company name changed in 1966 to Mobil Oil Company and in 1998, Exxon Corporation merged with Mobil Oil Company to form Exxon Mobil Corporation, the successor to VCC.

Main historic facility structures included the main fertilizer building, acid chambers, storage buildings, burner house, coal pile, and reservoir. Historical site features are shown on Figure 1-3.

1.3.2 Site Location

The former VCC Site is located in Atlanta, DeKalb County, Georgia (Figure 1-1). The Site is currently bounded by the MARTA/CSX railroads and LaFrance Street (a.k.a. College Avenue, NE) to the north; Wade Avenue and Hardee Street to the south; Wesley Avenue and a small branch of Sugar Creek to the west; and the western boundary of the DeKalb County Land Lot 210B of District 15 (formerly Clay Street) to the east (Figure 1-2). Figure 1-2 also shows the current tax parcel property boundaries in the vicinity of the Site. The geographical location of the center of the Site is at approximately 33.7586° north latitude and 84.3325° west longitude.

1.3.3 Land Cover and Vegetation

The Site lies within the Piedmont physiographic province of Georgia, which is characterized by a gently rolling landscape that increases in intensity approaching the Valley and Ridge and Blue Ridge provinces to the north. Topographic relief in the

vicinity of the former VCC property is moderate, with ground surface elevations generally varying from 940 to 1,030 feet above mean sea level (amsl) (EDR, 2005).

The Site is currently occupied by a mix of residential, commercial, vacant, undeveloped, recreational, and other (i.e., roads) types of property. Residential properties include the LaFrance Street Loft Condominiums, Arizona Lofts, Edgewood Court Apartments, and residential properties along Wesley Avenue, NE (Figure 1-2). Commercial properties include the Atlanta Public Schools Service Center, the Lloyd Property, Consolidated Fuzz Property, and the Edwards Baking Company Property. Undeveloped/vacant property includes the Pacific & Southern Properties. Recreational properties include the Atlanta Youth Soccer Association Property and Gilliam Park.

Adjacent property usage includes commercial, industrial, recreational, residential, and vacant/undeveloped properties located on all sides of the Site. Figure 1-3 depicts the approximate locations of major structures, improvements, and other features now or formerly situated within and adjacent to the boundaries of the Site.

A branch of Sugar Creek, which forms the western boundary of the former VCC property, is the most prominent surface water body in the vicinity of the Site. This branch of Sugar Creek empties into Sugar Creek approximately 1.2 miles south of the Site. Sugar Creek empties into the South River that flows southeasterly into Jackson Lake reservoir, near Stewart, Georgia. The Site lies within the Ocmulgee River drainage Basin; the Ocmulgee River empties into the Atlanta Ocean near Darien, Georgia (southeastern Georgia).

1.3.4 Regional Geology and Hydrogeology

In the Piedmont province of Georgia, bedrock is typically overlain by a layer of regolith. Regolith varies in both thickness and composition and typically includes topsoil, alluvium, and/or saprolite depending on the topography and geologic history of the area. Saprolite, which is commonly a major component of regolith, is soil formed by the in situ chemical and physical weathering of igneous or metamorphic bedrock. Regolith is typically underlain by ancient crystalline bedrock, which is sometimes referred to as basement rock.

The Piedmont physiographic provinces of the southeastern United States are characterized by a two-part groundwater system, comprised of regolith and bedrock. The regolith is the primary storage reservoir for the underlying bedrock and has high porosity and low permeability. Precipitation is stored as groundwater in the

intergranular spaces of the regolith as it infiltrates through the subsurface. The water table typically exists with the regolith, and the direction of shallow groundwater flow generally mimics the slope of the land surface. Within the underlying crystalline bedrock, there are few primary pore spaces due to the intense heat and pressure under which the bedrock formed. Due to the lack of pore spaces, the primary porosity and permeability of unweathered and unfractured bedrock is very low. Groundwater storage and movement within bedrock is typically dominated by secondary features (i.e., bedrock fractures). Bedrock fractures are common in the Piedmont physiographic provinces and may serve as conduits for groundwater movement (adapted from LeGrand, 2004).

Based on a *Geologic Map of Georgia* (GA Geological Survey, 1976), the bedrock underlying Atlanta and DeKalb County consists of interlayered metamorphic rock (including amphibolites, gneiss, mica schist), which formed during the Pennsylvanian Age of geologic time (320 to 286 million years ago).

1.4 Summary of the Previous Investigation

Between September and November of 2006, a site investigation was performed by BBL (now known as ARCADIS) on behalf of EMES to evaluate the magnitude and extent of arsenic- and lead-impacted media. This investigation was completed in accordance with the USEPA-approved Preliminary Assessment/Site Investigation (PA/SI) Work Plan (BBL, 2005) and included collection of soil, sediment, groundwater, and surface water samples. Analytical results indicated the presence of elevated concentrations of arsenic and lead in soil and groundwater collected from the northern portion of the Site. The highest concentrations of arsenic and lead were detected in soil samples collected from the commercial area of the property owned by the Atlanta Public Schools in the vicinity of the former acid chambers. Arsenic and lead were also detected in samples collected from one of the three groundwater monitoring wells installed at concentrations just above USEPA's Maximum Contaminant Level (MCL) of 10 micrograms per liter ($\mu\text{g/L}$) for arsenic and 15 $\mu\text{g/L}$ for lead. Surface water and sediment samples collected from four locations at the Site did not contain elevated concentrations of arsenic or lead. The results of this initial investigation were described in the PA/SI Report (BBL, 2007).

1.5 Report Organization

The introduction provided in this section is followed in Section 2 by a description of the delineation activities performed to characterize the presence and extent of arsenic and

lead in site-media. Section 3 summarizes the data generated during these and previous delineation activities. Section 4 presents the proposed removal action strategy and Section 5 presents specific details of the proposed removal action. References cited in this report are included in Section 6.

This report also has three appendices. These appendices includes visual soil classifications, monitoring well construction logs, and copies of the waste manifests documenting the removal of investigation-derived waste (IDW).

2. Data Collection Activities

2.1 Introduction

Soil and groundwater samples were collected to evaluate and refine the presence and extent of arsenic and lead at the former VCC Site. Representatives of ARCADIS implemented and oversaw all field activities in support of the investigation, which took place between September and November 2006 and in June 2008. Unless otherwise specified in this report, all investigation activities were performed in accordance with the Work Plan.

2.2 Delineation Strategy

Between September and November 2006, ARCADIS, on behalf of EMES, collected soil, groundwater, sediment, and surface water samples from the Site. Analytical data were compared to USEPA screening levels considered to be protective of human health and the environment. Results indicate that soil and groundwater contained arsenic and lead at concentrations exceeding USEPA's screening levels. Based on these results, EMES performed additional sampling activities to delineate the extent of impacted soil and groundwater.

The additional delineation activities included the collection of soil and groundwater samples from the northern and north-central portions of the Site in the vicinity of the former fertilizer structures to refine the limits of areas that may also require a removal action. Three additional groundwater monitoring wells were also installed in June 2008 to support the data collection activities.

2.3 Pre-Delineation Activities

Prior to the start of sampling, EMES obtained written permission from each of the affected property owners to enter the properties and collect samples. Before beginning any subsurface activities, the locations of underground utilities were identified by the public utility locating service to minimize the possibility of disrupting services to the property and to protect the safety of the workers. To further confirm the absence of utilities, a private utility locating company, UP Spec Services, Inc. of Cleveland, Georgia, was contracted to clear all areas where subsurface work was to be performed.

2.4 Soil Sampling and Analysis

Between September and November 2006, on behalf of EMES, ARCADIS collected 162 soil samples from 60 soil boring locations. As described above, ARCADIS returned in June 2008 to complete the delineation discussed in the Work Plan and collected an additional 82 soil samples from 28 soil boring locations. In all, a total of 244 soil samples were collected from 88 soil borings advanced at the locations shown on Figure 2-1.

At each soil boring location, soil samples were collected using a properly decontaminated stainless steel hand auger. Samples were collected from 0 to 0.5 feet, 0.5 to 2 feet, and in 2-foot intervals thereafter to a maximum depth of 8 feet below ground surface (bgs) or until groundwater or refusal was encountered, whichever occurred first.

Soil samples were screened in the field for arsenic and lead using a portable X-ray fluorescence machine (XRF) and were submitted to, and analyzed by TestAmerica, Inc. of Nashville, Tennessee (TestAmerica) for arsenic and lead. A summary of the soil samples collected is presented in Table 2-1; physical descriptions of these soil samples are presented in Appendix A.

Toxicity Characteristic Leachate Procedure (TCLP) leaching analyses were performed on soil samples collected from seven locations where soil arsenic and/or lead concentrations exceeded the USEPA screening levels. These analyses determine appropriate disposal requirements for soil for evaluating potential soil removal alternatives. In general, TCLP analyses were performed using a composite of the soil samples collected from the ground surface to the maximum depth at which laboratory analyses indicated the presence of arsenic or lead at concentrations above USEPA screening levels. The specific samples selected for TCLP analyses were determined following receipt of the preliminary laboratory analytical data. These composite soil samples were analyzed for total arsenic and lead and TCLP metals. Locations of soil samples analyzed for TCLP are shown on Figure 2-1. A summary of the waste characterization soil samples collected is provided in Table 2-1.

2.5 Groundwater Sampling and Analysis

2.5.1 Monitoring Well Installation

Three groundwater monitoring wells (ATLMW-01 through ATLMW-03) were installed in 2006 to assess shallow groundwater quality and to evaluate the occurrence and flow of shallow groundwater at the Site. In 2008, three additional groundwater monitoring wells (ATL-MW-04 through ATL-MW-06) were installed to delineate the extent of arsenic and lead concentrations in groundwater and to obtain additional groundwater data downgradient of existing monitoring well ATL-MW-02.

Prior to construction, a soil boring was advanced at each of the proposed monitoring well locations and the soil was screened in the field using an XRF. Monitoring wells ATL-MW-01, -02, -03, and -04 were completed as single-cased monitoring wells while monitoring wells ATL-MW-05 and -06 were completed as double-cased wells due to the observation of potential magenta slag. All wells were screened across the water table and developed in accordance with the procedures specified in the Work Plan. The locations of the monitoring wells are shown on Figure 2-2. Groundwater monitoring well specifications are provided in Table 2-2 while construction details and well construction logs are presented in Appendix B.

2.5.2 Groundwater Elevation Measurement

Groundwater elevations were measured at the monitoring wells and existing surface water staff gauges to provide data for the development of a groundwater potentiometric surface map. Depth-to-water measurements were performed in accordance with the procedures specified in the Work Plan. Groundwater and surface water elevations are provided in Tables 2-3 and 2-4, respectively.

2.5.3 Groundwater Sample Collection and Analyses

Groundwater samples were collected in 2006 and 2008 using low-flow/low-stress sampling techniques in accordance with the procedures specified in the Work Plan. Groundwater samples were analyzed by TestAmerica for arsenic and lead. In addition, groundwater was measured in the field for pH, temperature, conductivity, dissolved oxygen, turbidity, and redox potential using a Horiba U-22 multi-parameter water quality meter with a flow-through cell. A summary of the groundwater sampling program is presented in Table 2-1.

2.6 Surface Water Sampling and Analysis

Four surface water samples were collected at the Site in September 2006 from the locations shown on Figure 2-2 to evaluate whether surface water drainage pathways are potential sources for the offsite migration of contaminants. Surface water samples were analyzed for arsenic and lead. A summary of the surface water sampling program is presented in Table 2-1.

2.7 Sediment Sampling and Analysis

Four sediment samples were collected at the Site in September 2006 at the locations shown on Figure 2-2. These samples were collected to evaluate whether surface water drainage pathways are potential sources for the offsite migration of contaminants. Samples were collected from 0 to 0.5 feet below sediment surface and analyzed for arsenic and lead. A summary of the sediment sampling program is presented in Table 2-1.

2.8 Investigation-Derived Waste Sampling

A total of 48 drums (13 containing liquid and 37 containing soil/debris/personal protective equipment [PPE]) of IDW were generated during the 2006 and 2008 sampling activities at the Site. Composite samples were collected to characterize the IDW. Drums containing solids were analyzed for TCLP metals and pH, while drums containing aqueous decontamination solutions were analyzed for target analyte list (TAL) metals and pH. Samples were collected in accordance with the procedures specified in the Work Plan. A summary of the IDW sampling program is provided in Table 2-1.

2.9 Surveying

Surveying was conducted by DLM Civil Engineering & Land Surveying of Kennesaw, Georgia. All soil borings and monitoring wells were surveyed for horizontal and/or vertical control. All survey data was referenced to the North American Horizontal Datum of 1983 and the North American Vertical Datum of 1988.

2.10 Data Validation

Laboratory analytical data were validated by ARCADIS in accordance with the procedures outlined in the Quality Assurance Project Plan (QAPP) contained in the

Work Plan. Data validation entails a review of the quality control (QC) data and the raw data to verify that the laboratory was operating within required limits, the analytical results are correctly transcribed from the instrument read outs, and which, if any, environmental samples are related to any deficient QC samples. The objective of the data validation is to identify any questionable or invalid laboratory measurements and to determine if the quality is sufficient to meet the data quality objectives.

3. Summary of Results

3.1 Introduction

This section of the report describes the results of the data collection activities described in Section 2.

3.2 Development of Media-Specific Action Levels

The acid chambers used in the fertilizer production process represent the greatest potential for adverse environmental impacts (USEPA, 1997). During periodic cleaning of the lead chambers, it is believed that washdown water containing acid and soluble lead was flushed onto the ground surface. Pyrite cinders that did not burn completely in the combustion chambers were frequently used as onsite fill material. This slag material has a reddish (magenta) appearance and has been found to contain elevated levels of inorganic constituents, primarily arsenic and lead.

Experience at the other former VCC Sites in USEPA Region 4 indicates that site-related constituents of concern (COCs) are arsenic and lead. At this Site, arsenic and lead are the COCs; therefore, the RAWP presented in Section 5 will address arsenic and lead.

3.2.1 Soil Standards

Soil sample locations were divided into two categories, residential/recreational and commercial properties, each having its own set of screening levels. The site-specific action levels (SSALs) for the residential properties are 27 milligrams per kilogram (mg/kg) for arsenic and 400 mg/kg for lead. The screening levels for the commercial properties were 27 mg/kg for arsenic and 800 mg/kg for lead. The screening level for arsenic of 27 mg/kg is a USEPA-determined value which is used as a remediation endpoint at similar former VCC fertilizer sites in USEPA Region 4. The screening level for lead of 400 mg/kg is based on the USEPA Region 9 Preliminary Remediation Goal (PRG) for sites with residential use, while the screening level for lead of 800 mg/kg is the USEPA Region 9 PRG for sites with industrial use.

3.2.2 Groundwater Standards

Groundwater standards are based on the USEPA's MCLs for drinking water. Similar to the soil standards described above, MCLs are considered to be applicable only for Site

COCs (arsenic and lead). The MCLs for arsenic and lead are 10 µg/L and 15 µg/L, respectively.

3.2.3 Sediment Standards

Standards selected for evaluating arsenic and lead concentrations in sediment are based on the USEPA standards for residential soil, as discussed above. Therefore, the SSALs for arsenic and lead in sediment are 27 mg/kg and 400 mg/kg, respectively.

3.2.4 Surface Water Standards

Surface water standards are based on MCLs in drinking water developed by the USEPA. The MCLs for arsenic and lead are 10 µg/L and 15 µg/L, respectively.

3.3 Soil Sample Results

During the combined 2006 and 2008 site investigation and delineation activities, a total of 244 soil samples from 88 soil borings were analyzed for arsenic and lead. Arsenic and/or lead were detected above the SSALs in two distinct areas at the Site (Figure 3-1). The largest contiguous area containing elevated concentrations of arsenic and/or lead is located in the north-central portion of the Site near the approximate location of the former fertilizer structures. The second area, located in the northeast corner of the Site, contains only one soil boring with arsenic and lead concentrations above the SSALs.

The maximum arsenic and lead concentrations of 1,260 mg/kg and 2,660 mg/kg, respectively, were collected from soil boring ATL-SB-020 located near the radio tower. Soil pH levels varied between 4.3 and 7.8 standard units. Soil boring locations with arsenic and/or lead concentrations greater than the screening levels are presented on Figure 3-1. Laboratory analytical data for samples collected from the residential/recreational and commercial properties are presented in Tables 3-1 and 3-2, respectively.

Additional soil sampling will be conducted along the western property boundary west of the branch of Sugar Creek to define the western limits of arsenic- and lead-impacted soils. Soil sampling will be conducted prior to initiating the removal action.

3.4 Groundwater Occurrence and Movement

Water level measurements were collected under static groundwater conditions on October 11, 2006, November 9, 2006, and June 27, 2008. Groundwater elevations observed in June 2008 varied from 967.30 feet bgs (ATL-MW-05) to 999.18 feet bgs (ATL-MW-03). A groundwater potentiometric surface map for the June 2008 gauging event is depicted on Figure 3-2. The depth to groundwater and groundwater elevations are presented in Table 2-3.

As shown on the shallow groundwater potentiometric surface map (Figure 3-2), groundwater generally flows from northeast to southwest towards the Branch of Sugar Creek. The horizontal component of the groundwater hydraulic gradient, calculated from the groundwater elevation contours, was an average of 0.023 foot/foot across the site.

3.5 Groundwater Sample Results

Groundwater samples were collected in October and November of 2006 from three groundwater monitoring wells (ATL-MW-01 through ATL-MW-03) and on June 27, 2008, from the six monitoring wells (ATL-MW-01 through ATL-MW-06) installed at the Site (Figure 3-3). Groundwater pH measured in 2008 was generally stable and varied across the Site from 4.47 to 6.65 standard units.

Arsenic and lead concentrations were compared to the USEPA MCLs for drinking water of 10 µg/L and 15 µg/L, respectively. Arsenic and lead were detected at concentrations above the MCLs in samples collected from MW-02 during the 2006 event; however, during the 2008 groundwater sampling event, arsenic and lead were either not detected or detected at concentrations below the MCLs in all six wells sampled. Groundwater analytical results and field parameter data are presented in Table 3-3 and shown on Figure 3-3.

3.6 Surface Water Sample Results

Surface water samples were collected from four locations on the Site on September 26, 2006 that included two locations in the branch of Sugar Creek and two locations in the unnamed creek that traverses the Site (Figure 3-4).

Arsenic and lead were not detected in three of the four surface water samples (ATL-SW-01, -03, and -04) collected from the Site. Arsenic and lead concentrations in ATL-

SW-02 were 8.5 µg/L and 4.3 µg/L, respectively, which are less than the SSALs. Surface water analytical results and field parameter data are presented in Table 3-4 and Figure 3-4.

3.7 Sediment Sample Results

During the 2006 site investigation activities, four sediment samples were collected at the Site at the locations shown on Figure 3-4. Samples were collected from 0 to 0.5 feet below sediment surface and analyzed for arsenic and lead. The maximum arsenic and lead concentrations detected in sediment were 10.4 mg/kg and 83.4 mg/kg in sample ATL-SD-02, respectively. None of the sediment samples had concentrations greater than the soil screening levels of 27 mg/kg for arsenic and 400 mg/kg for lead. A summary of the sediment sample analytical results is provided in Table 3-5 and depicted on Figure 3-4.

3.8 Waste Characterization Results

Seven soil samples were analyzed for TCLP metals during the 2008 investigation. In general, samples were composited from the ground surface to the depth at which laboratory analyses indicated the presence of arsenic and/or lead at concentrations above the SSALs. The purpose of the TCLP analyses is to provide data which may be used to characterize the impacted soil for off-site disposal.

All seven soil samples analyzed for TCLP metals were less than the Resource Conservation and Recovery Act (RCRA) standards described in 40 CFR Part 261.24 that determine if the soil may be a characteristically hazardous waste. TCLP arsenic was not detected in any of the soil samples analyzed and the maximum concentration of TCLP lead was 1.36 milligrams per liter (mg/L). A summary of the waste characterization results is presented in Table 3-6.

3.9 Investigation-Derived Waste Sampling and Disposal

A total of 48 drums (11 containing liquid and 37 containing soil/sampling debris/personal protective equipment) were generated during the sampling activities at the Site. Sample results are presented in Table 3-7. Based on the laboratory analytical results, all waste was classified as non-hazardous material. Haz-Mat Transportation and Disposal, Inc. transported and disposed of aqueous waste materials at their Charlotte, North Carolina facility while the solid waste was transported and disposed at the Allied CMS Landfill located in Concord, North Carolina. Waste was transported and

ARCADIS

SDR / RAWP

VCC – Atlanta, DeKalb
County, GA

disposed of in accordance with all applicable regulations. Copies of the waste manifests are provided in Appendix C.

4. Removal Action Strategy

4.1 Introduction

As described in Section 3, arsenic and lead were detected in soil above the USEPA screening levels. To address the arsenic- and lead-impacted soil, EMES will perform a combination of soil excavation activities with off-site disposal and installation of an asphalt cap.

4.2 Removal Action

The removal action for this Site was developed to be protective of human health and the environment. The presence of arsenic and lead in soil above the SSALs represents a potential contact exposure risk to persons working in impacted soil. The following sections describe the removal actions for the Site.

The impacted soil areas have been divided into 7 areas as shown on Figure 4-1. An asphalt cap will be installed over soils in Areas 1, 2, and 3 while the impacted soils in Areas 4, 5, and 6 will be excavated and disposed offsite. Additional areas for soil excavation may be added to the removal action based on the results of the additional soil sampling in Area 7 that will be conducted to the west of the branch of Sugar Creek.

4.2.1 Installation of an Asphalt Cap

The first portion of the removal plan for this Site includes the installation of a cover system over Areas 1, 2 and 3 as shown on Figure 4-1 for a total of approximately 4.8 acres capped (Table 4-1). Based on the current use of the property, the cover in Areas 1, 2, and 3 will consist of an asphalt cap that will minimize the risk for potential contact exposure to persons working on the property. An extra benefit of the asphalt cap is that it will also minimize infiltration of rainwater.

Area 1 houses a TV/radio tower that is accessed from New Street NE. The excavation of soils around the tower is not practical. Area 1 also consists of undeveloped land that if paved could be used as additional storage areas for the Atlanta Public Schools maintenance yard. Area 2 consists of concrete and asphalt pavement that is in poor condition; therefore the asphalt cap in Area 2 would replace the existing pavement. Area 3 consists of an unpaved parking area and equipment lay down area.

4.2.2 Soil Removal

The second portion of the removal plan for this Site includes the excavation and off-site disposal of soil from Areas 4, 5, and 6, and potentially Area 7, as shown on Figure 4-1. Area 4 consists of vegetated undeveloped land and storage/parking areas while Area 5 is a small area just north of a warehouse. Area 6 consists of the creek bed and eastern bank of the branch of Sugar Creek along the western property boundary. Area 7 consists of the western bank of the branch of Sugar Creek west of the property boundary which will be sampled prior to the start of the removal action.

Soil will be removed based on detected concentrations of arsenic and/or lead above the SSALs and the ability to access those soils. The removal of all impacted soil may not be practical due to the presence of subsurface utilities or nearby structures.

Figure 4-1 depicts the horizontal limits of impacted areas which are based on the presence or absence of arsenic or lead above the SSALs in samples collected from soil borings. The vertical limits of impacted soil are based on the maximum depth at which arsenic and/or lead was detected above the SSALs in individual soil borings. The soil removal includes the excavation of soil from approximately 0.85 acres to a depth of 2 feet for a volume of approximately 2,750 cubic yards (Table 4-1). Additional soil may be removed in Area 7 based on the results of the sampling that will be conducted prior to the removal action. Based on the results of the TCLP analyses, impacted soils are classified as non-hazardous soil; therefore, excavated soil will be transported off-site and disposed of at an USEPA-approved non-hazardous waste landfill. Soil removal volumes may increase if sampling in Area 7 indicates the need for additional soil removal in that area.

The intent of the removal action is to remove the maximum amount of impacted soil in Areas 4, 5, and 6 and possibly Area 7 to the extent practicable. If soil removal is not practicable to the maximum depth of impacted soil and arsenic and/or lead are still present in subsurface soils at concentrations above the SSALs, a high visibility, degradation resistant, demarcation liner will be installed at the base of the excavation and backfilled in place to identify the boundary between backfilled soil and unexcavated soil that contains arsenic and/or lead above SSALs.

4.2.3 Groundwater

The results of the groundwater sampling activities in 2008 indicate concentrations of arsenic and lead are below USEPA's MCLs. Therefore, no further action is needed for

groundwater. The six groundwater monitoring wells (ATL-MW-01 through ATL-MW-06) will be abandoned during the removal action.

4.2.4 Deed Restrictions

Areas where arsenic and/or lead have been detected above the SSALs that have impacted soil remaining at the conclusion of the removal action will be deed-restricted to limit the future use of the property and will be enrolled in a maintenance and monitoring program implemented by EMES. This program will include periodic (annual) inspections/maintenance to document the condition of the property, and will preserve the integrity of the restored areas and prevent exposure to, or excavation of, impacted soils by the property owner and utility workers. In the event that it becomes necessary in the future to excavate or remove additional impacted soil, soil removal activities will be coordinated with, and performed by, representatives of EMES.

5. Removal Action Work Plan

5.1 Introduction

The Removal Action Work Plan (RAWP) presented in this section has been prepared to outline the technical approach and methods for conducting a removal action at the Site. This RAWP includes two types of removal actions. The first includes the excavation and offsite disposal of select soils that exceed SSALs. Excavated areas will be backfilled and restored to existing conditions to the extent practicable, or in a manner that is acceptable to ExxonMobil and the affected property owners. The second type of removal action is the installation of a cover system over other soils that also exceed the SSALs.

Because residual concentrations of arsenic and/or lead above SSALs will remain beneath the cover system and may remain beneath excavated surfaces in some limited areas, ExxonMobil will negotiate deed restrictions with the affected property owners following the completion of the removal action. Properties where arsenic and/or lead remain will also be enrolled in an annual monitoring program that includes inspections to maintain the integrity of the restored areas and ground cover, and assistance to property owners or utility companies if it becomes necessary to excavate impacted soils that remain at the Site.

This RAWP provides a description of the overall strategy for implementation of the removal action at the Site. Detailed plans for implementing this strategy, including the protection of workers during construction activities, will be prepared by EMES's Removal Action Contractor (RAC). Plans prepared by the RAC will be submitted to USEPA for review, comment, and approval prior to the start of work.

5.1.1 Work Plan Objectives

The objectives of the removal action are to:

- Excavate and dispose of selected commercial areas with soil containing greater than or equal to 800 mg/kg of lead and 27 mg/kg of arsenic, to the extent practicable, in a manner satisfactory to USEPA;
- Excavate and dispose of selected residential areas with soil containing greater than or equal to 400 mg/kg of lead and 27 mg/kg of arsenic, to the extent practicable, in a manner satisfactory to USEPA;

- Backfill all excavated areas with imported materials;
- Restore the affected properties, to the extent practicable;
- Install a cover system over selected commercial areas with soil containing greater than or equal to 800 mg/kg of lead and 27 mg/kg of arsenic; and
- Repair fences, hard features, etc., in the event of accidental contact/damage.

5.2 Project Organization

This section describes the roles of the various organizations involved in developing and implementing the removal action.

5.2.1 Regulators/Agencies

The USEPA is the lead regulatory agency for this project. The USEPA On-Scene Coordinator (OSC) will be responsible for providing and coordinating regulatory oversight and direction, as necessary, including the review, comment, and approval of all required submittals. The USEPA OSC, or their designee, will also perform field oversight of all removal activities on behalf of the USEPA.

5.2.2 Responsible Party

EMES is the party responsible for VCC-related impacts to the Site. While the interests of EMES will be represented in the field by the Engineer and RAC (as described below), representatives of EMES will maintain an active role in the project through periodic Site visits, participation in project meeting updates, and review/approval of project activities and reports. The EMES Project Manager is Mr. Bruce Frink, P.E.

5.2.3 Engineer

On behalf of ExxonMobil, ARCADIS of Cary, North Carolina will be responsible for the engineering aspects of the removal action. General ARCADIS responsibilities include, but are not limited to, the following:

- preparing this RAWP and appendices;
- prepare asphalt cap design;

- reviewing materials prior to submittal to the USEPA;
- interfacing with regulatory agency personnel;
- collecting post-excavation and waste characterization samples;
- preparing and submitting status reports to the USEPA;
- managing field activities; and
- preparing and submitting the final report to the USEPA.

ARCADIS has designated Ms. Corinda Chwalek, P.E. as the Project Manager to oversee implementation of the above activities.

5.2.4 Removal Action Contractor

EMES will retain a RAC to perform the removal action. Responsibilities of the RAC include, but are not limited to, the following:

- preparing and submitting all plans, permits, and other submittals specified in this RAWP for approval by EMES and the USEPA;
- providing the labor, material, and equipment necessary to complete the removal activities in accordance with this RAWP and the approved project plans;
- coordinating the handling, transport, and disposal of waste material, including soils, residuals, and personal protective equipment;
- performing surveying; and
- providing site health and safety monitoring.

The RAC will appoint one member of its onsite team as the Site Supervisor. The Site Supervisor will be a qualified professional with experience in removal actions and will coordinate all activities in accordance with the RAWP. In the event that an unexpected circumstance may hinder or prevent the RAC from adhering to the RAWP or approved project plans, the Site Supervisor will consult immediately with the Engineer.

5.2.5 Waste Disposal Facility

Excavated soil that does not contain TCLP concentrations of lead or arsenic above 5 mg/L may be disposed at the following RCRA Subtitle D landfill:

Waste Management, Inc. / R & B Landfill
610 Bennett Road
Homer, Georgia 30547
Landfill Permit No.: 006-009 D

Excavated soil that contains TCLP concentrations of lead or arsenic above 5 mg/L will either be stabilized onsite and disposed of at one of the facilities described above, or will be disposed of offsite without stabilization at the following RCRA Subtitle C landfill:

Chemical Waste Management
P.O. Box 55
Highway 17 North, Mile Marker 163
Emelle, AL 35459
205-652-8156
RCRA No.: ALD000622464

Notifications for scheduled waste shipments will be submitted to the USEPA OSC prior to shipment.

5.2.6 Analytical Laboratory

TestAmerica has been selected for the analysis of post-excavation confirmation samples collected as part of this project. Additional laboratories will not be used to process confirmation samples from the Site without prior approval from the USEPA.

5.3 Technical Approach and Scope of Work

This removal action consists of soil removal activities and installation of an asphalt cap. Figure 4-1 depicts the impacted areas, areas for soil removal and approximate depths, and areas for the installation of the cover system. Select areas containing impacted media will be excavated and disposed of off-site in accordance with all applicable regulations. Excavated soil areas will be backfilled with imported fill and restored as described in Section 5.3.11 and restored to pre-existing conditions. A cover system

consisting of an asphalt cap will be installed over select areas containing impacted media.

The following sections describe these activities in more detail.

5.3.1 Asphalt Cap Design

Once the overall strategy for the Site has been approved by USEPA, EMES and ARCADIS will meet with the affected property owners to discuss the design of the asphalt cap. The cap will be designed based on the intended use by the property owner.

5.3.2 Securing Access Agreements for Construction

Upon approval by the USEPA, EMES will then begin contacting affected property owners to obtain access agreements to perform the work. No work will be performed on any property until a reasonable access agreement has been signed by the existing property owner.

5.3.3 Mobilization

Prior to mobilization, the RAC will prepare submittals for review and approval by the USEPA. These submittals include a Site Operations Plan (which includes an Erosion and Sedimentation Control Plan, Traffic Control Plan, Dust Control Plan, Noise Control Plan, Stormwater Management Plan, Decontamination Plan, Site Security Plan, Project Schedule, and Contingency Plan) and a Health and Safety Plan (HASP). A detailed description of the required contents of these submittals is presented in Section 5.3.10. Equipment and personnel needed to implement the removal action will then be mobilized to the Site. Local suppliers for goods and services (e.g., water, portable toilets, landscaping materials) will be identified upon mobilization to the Site.

5.3.4 Preparation of the Site for Removal Activities

The following sections describe the activities that will be performed at the Site to prepare for the intrusive phases of the removal action.

5.3.4.1 *Installation of Erosion and Sediment Control Measures*

Erosion and sediment control (E&SC) measures (e.g., silt fence, hay bales) will be installed at the Site to prevent the migration of soil-bound contaminants to surface water bodies. The type and location of E&SC measures to be installed will be specified in the E&SC Plan prepared by the RAC. E&SC measures will be inspected regularly by the RAC to monitor their continued effectiveness. Additional E&SC measures will be installed, as necessary, as the removal action progresses to prevent the transport of eroded soil from the Site.

Appropriate measures will be taken to minimize the volume of water accumulating in areas of disturbed soil that potentially contain elevated metals concentrations. Water that does not come into direct contact with disturbed soil will be directly discharged into the appropriate drainage feature. Water that has contacted disturbed soil that potentially contains elevated levels of arsenic or lead will be sampled and/or treated in accordance with the Stormwater Management Plan prepared by the RAC prior to removal for offsite disposal or discharge.

5.3.4.2 *Subsurface Utility Markout*

All necessary precautions will be taken to protect the various subsurface and aboveground utilities that exist at the Site from damage. A review of all available Site plans and/or as-builts will be conducted to identify the general location of subsurface utilities. Necessary permits and utility clearances will be obtained prior to any subsurface activities. The utility companies (and/or any private organization that is authorized by the utility companies to delineate the presence of all subsurface services) will be contacted at least 72 hours before onsite intrusive activities are started. A utility markout will be conducted at the Site to locate all subsurface utilities (e.g., electrical, telephone, cable television). In addition, a private utility locating contractor (or equivalent) will scan the area for the presence of subsurface utilities prior to excavation. The field copy of the Site plans will then be updated with the information obtained from the markout. During the markout, the location of aboveground utilities will also be identified. Section 5.3.7 describes the minimum requirements that will be taken to protect the utilities.

5.3.5 *Clearing and Grubbing*

Clearing and grubbing of the soil removal and cover areas will be performed prior to or concurrent with soil excavation activities. The aboveground portions of the trees will

either be disposed of off-site or chipped and reused on-site for the construction of haul roads and/or dust control. Portions of the vegetation in contact with the soil (e.g., stumps, roots) will be excavated with the soil and disposed of off-site.

5.3.6 Installation of a Cover System

One portion of the removal plan for this Site includes the installation of a cover system over two areas of the Site. As shown on Figure 4-1, Areas 1, 2, and 3 include approximately 4.8 acres. Based on the current use of the property, the proposed cover system will consist of an asphalt cap installed over impacted soils to prevent potential contact exposure to persons working on the property and to minimize infiltration of surface water through the impacted soils. The cover will be designed based on the property owners intended use which may include a parking lot or storage area with light to moderate truck usage.

ARCADIS will provide a design for the asphalt cover system. The cover system will be designed by a registered professional engineer and would have the following qualities:

- Permeability such as to minimize surface water infiltration;
- Sufficient strength to support vehicle traffic;
- Durability with low maintenance; and
- Ease of construction.

The cover design will also consider the following:

- The expected size and load classifications of vehicles;
- Surface drainage;
- Impacts to the adjacent creek; and
- An annual maintenance plan of pavement inspection, early detection and repair of cracks and surface breaks, and provisions for repair and/or re-pavement.

5.3.6.1 Proposed Cap Design and Installation

The asphalt cap will be designed to promote stormwater runoff to a collection and drainage system with a discharge to the branch of Sugar Creek. The cap will contain the majority of the stormwater on-site and will prevent flow from the bordering properties from entering the Site.

Any materials excavated to reach the proposed subgrades prior to installation of the asphalt cap will be disposed offsite with the other soils excavated as part of this removal action. Additional fill, if necessary, will be completed with granular subbase material. Grading and contouring specifications will be included with the cover system design prepared by ARCADIS.

The asphalt cap will include a granular subbase, bituminous base course, and bituminous top layer placed on a prepared subgrade. A typical cross-section of the asphalt cap is provided in Figure 5-1. The final design specifications for the material, placement, and compaction will be submitted by ARCADIS.

5.3.6.2 Asphalt Cap Maintenance

Following completion of the asphalt cap construction activities, the asphalt will be allowed to cure for approximately two weeks. The asphalt will be inspected annually by EMES to determine if/when maintenance activities are required to maintain the integrity of the cap. Maintenance activities may include patching of holes, sealing of cracks, and filling of depressions, if any. The storm water management system will also be inspected annually and cleaned as warranted.

5.3.7 Excavation of Impacted Soil

The second portion of the removal action plan includes the excavation and off-site disposal of arsenic- and lead-impacted soil. To the extent practicable, soil will be excavated from the areas described in Section 4.2 and shown on Figure 4-1, loaded into trucks, and transported to a RCRA Subtitle D landfill. The estimated areal dimensions, depths, and in-place volumes for each excavated area are presented in Table 4-1. Soil will generally be removed using standard construction equipment (e.g., backhoe, trackhoe) and manual shoveling. Large pieces of construction debris (e.g., chunks of concrete, brick foundations), greater than or equal to approximately 1 cubic yard, will either be left in place or will be cleaned and left on site at a location agreeable to the property owner. Dry decontamination methods (e.g., brushing) will be used to remove impacted soil from the surfaces of this debris. Wet decontamination methods, such as pressure washing, may be used to remove residual soils if dry decontamination methods are not adequate. Smaller debris such as bricks will be excavated and handled with the excavated soil.

The depth of excavation at the Site will generally be 2 feet bgs; however, the actual limits of excavation will be determined in the field based on the results of the

confirmation soil sampling program and the presence of subsurface utilities. The initial depth of excavation of 2 feet is based on data generated from soil sampling performed in 2006 and 2008.

Excavation sidewalls adjacent to paved areas will be sloped to prevent undermining. At the elevation of the bottom of the pavement, excavation will be performed at least 6 inches laterally from the toe of the pavement before deeper excavation continues. Additional excavation will be performed by sloping or benching the excavation adjacent to these areas at a slope no greater than a 1V:2H. The RAC will perform a structural analysis prior to mobilization to evaluate whether less aggressive sloping may be required to protect existing Site structures. The RAC's structural analysis will be included in the Site Operations Plan.

Waste characterization analyses have been performed at select boring locations within the excavation areas. The purpose of this sampling was to characterize impacted soils for disposal. Soil sample results indicate that the soil TCLP concentrations were less than the regulatory standards and therefore can be disposed of at a RCRA Subtitle D landfill. It should be noted that excavated soils disposed of off-site will, at a minimum, be required to pass USEPA's liquid waste characterization test (also known as the paint filter test).

Excavation within utility corridors will be conducted by hand or in accordance with utility owner specifications, whichever is more stringent. No mechanical excavation (e.g., by excavators) will take place within 2.5 feet of a marked subsurface utility. All excavation to be performed within 2.5 feet of a marked subsurface utility (except as specified above) will be performed manually. Utilities will be protected in the manner prescribed by the utility company. The following describes the general actions that will be taken to protect the utilities:

1. Excavation of soil above and adjacent to a known utility will be performed manually in accordance with the methods, tolerances, and directions specified by the utility owner. At a minimum, all excavation above or within 2.5 feet of a marked utility will be performed manually. The use of an air spade or other similar equipment to remove soil around utilities will be discussed with utility owners on an individual basis.
2. Soil beneath any piped utilities or electric lines may be removed based on the ability to relocate the utility during excavation. Piped utilities include water lines and underground drain lines (if present). Piped utilities do not include phone

lines and cable television lines. These lines are generally flexible and can be relocated within the excavation areas as work progresses.

3. If piped utilities are to be left in place during excavation, a soil shelf equal to the width of the pipe, plus a minimum of 6 inches on each side of the pipe will be left in place beneath the exposed piped utility for support. Soil beneath the piped utilities will then be sloped from the top edge of the shelf to the bottom of the excavation at a slope no greater than 1V:2H.

Modifications to the above procedures may be proposed and, if approved, included in the Site Operations Plan (Section 5.3.10.1).

5.3.8 Confirmation Sampling Plan

A confirmation sampling and analysis program will be conducted during the soil removal work to guide the excavation activities and confirm that impacted materials have been removed.

Following removal of the soil to the initial depths listed in Table 4-1 and shown on Figure 4-1, field screening will be conducted at the base of the excavation using a portable XRF instrument. If XRF screening of the surficial soil at the base of the excavation indicates that arsenic and/or lead concentrations are greater than the SSALs, additional rounds of soil removal and XRF screening will be conducted, as appropriate, to verify that sufficient soil has been removed from the excavation. This XRF screening procedure may be modified in the field, as necessary, to improve its effectiveness.

Upon completion of soil removal activities, one five-point composite sample will be collected from each 0.25-acre area excavated. All samples will be collected from the base of the excavation from 0 to 6 inches below ground surface and will be analyzed for total arsenic and lead. Samples, including field QC samples, will be collected and analyzed in accordance with the procedures in the Field Sampling Plan and QAPP included in the Work Plan.

Rapid (24- to 48-hour) turn-around of sample analyses will be requested so that results can be reviewed and evaluated prior to the onset of backfilling. If analyses indicate arsenic and lead concentrations are below the SSALs, the excavation area will be backfilled and restored as described in Section 5.3.11. However, if arsenic or lead are

detected at concentrations above the SSALs, additional rounds of vertical soil removal and confirmation sampling will be conducted as appropriate.

5.3.9 Transport to Disposal Facility

Results of TCLP analyses of onsite soils have indicated that excavated soils are suitable for transport to a RCRA Subtitle D landfill for disposal. The RAC will be responsible for coordinating and scheduling the transport vehicles and loading the materials. All waste streams will be characterized before disposal, as required by applicable federal, state, and local laws, rules, and regulations, as well as any additional requirements imposed by the receiving landfill or disposal facility.

Excavated soil will be loaded into dump trucks for transport to the disposal facility. Traffic patterns will be established in the Traffic Control Plan to minimize or prevent trucks that are hauling soil offsite from traversing bare soil in impacted areas. Trucks that traverse areas containing impacted soils will be decontaminated prior to exiting the impacted areas. Decontamination procedures will be described in the RAC's Site Operations Plan.

All containers used for the offsite transport of materials will be covered with tarps prior to offsite transport. The RAC will be responsible for verifying that all transportation containers are tarped, manifested, and placarded in accordance with appropriate RCRA and Department of Transportation (DOT) requirements before leaving the Site.

The weight of the transportation containers prior to departure from the Site will be within its allowable loaded capacity for subsequent transport and in compliance with any and all DOT regulations. A daily log of information that includes the date and time, container identification number, and measured weight of each loaded transportation container to have departed the Site will be compiled.

5.3.10 Submittals

The RAC will prepare documents that describe in detail how the project will be performed. The following documents will be submitted to USEPA for review and comment/approval prior to mobilization to the Site:

- Site Operations Plan; and
- HASP.

The contents of each of these plans are described in the following sections.

5.3.10.1 Site Operations Plan

The RAC will prepare a Site Operations Plan that will include, but not be limited to, the following items:

- detailed description of the strategy and procedures to be used to accomplish the work;
- detailed description of the sequence of Site excavation and restoration activities;
- detailed description of the procedures used to document pre-removal Site conditions;
- list of equipment to be used onsite;
- proposed locations for storage areas, access roads, and material loading areas;
- structural analysis defining safe excavation tolerances adjacent to buildings, utility poles, and other structures or areas covered with pavement;
- Erosion and Sedimentation Control Plan;
- Traffic Management Plan;
- Dust Control Plan;
- Noise Control Plan;
- Stormwater Management Plan;
- Excavation Equipment Decontamination Plan;
- Site Security Plan;
- Contingency Plan; and
- Project Schedule.

The Site Operations Plan will summarize the materials, procedures, controls, and equipment that the RAC intends to utilize during performance of the removal action. The Site Operations Plan will address all appropriate issues associated with performing the work and will include detail sufficient for USEPA review and approval.

To the extent possible, all utilities should remain operable. Any temporary shutdown of utilities will be scheduled in advance and coordinated with the local utility companies, affected property owner(s), and representatives of EMES. To the extent possible, open excavation areas will also be minimized.

Erosion and Sedimentation Control Plan

During the performance of the removal action, the RAC will take all necessary precautions to protect the environment. In doing so, the RAC will protect all water courses, surface waters, groundwater, soils, and air from degradation or damage in accordance with all federal, state, and local laws and regulations.

The RAC will prepare an Erosion and Sediment Control Plan that will describe procedures and controls that will be employed to prevent accelerated erosion of areas subject to remediation and to prevent excess sedimentation in drainage pathways. At a minimum, this will include the placement and maintenance of silt fences or other appropriate controls at the appropriate locations around all excavations and temporary material staging areas. All erosion and sedimentation control measures will be inspected regularly and especially after any significant rainfall event to document that maximum control continues to be provided. Following inspection, the erosion and sedimentation control measures will be modified, cleaned, reinforced, replaced, and/or maintained, as necessary.

Permanent erosion control measures will also be installed at the Site in Area 6. This will consist of a riprap lined slope from the asphalt cap in Area 1 to the branch of Sugar Creek. The riprap will also serve as stabilization for the bank and cap. The design of the permanent erosion control measures will be submitted by ARCADIS prior to installation.

Traffic Management Plan

The RAC will prepare a Traffic Management Plan that will describe procedures for the movement of trucks and equipment across the Site and to the selected disposal facility in a safe and responsible manner. The Traffic Management Plan will include descriptions of traffic and/or equipment flow patterns across the Site, descriptions of how trucks transporting materials to the landfill will be staged, and other appropriate provisions for personnel (e.g., flagmen, traffic cones, signs) that will be required to promote the safe passage of trucks/equipment across and adjacent to the Site.

Dust Control Plan

Dust will be controlled based on visual observations and the results of airborne particulate monitoring performed by the RAC. Measures will be taken to control dust produced by excavation, backfilling, loading, and other work-area activities. The RAC

will develop a Dust Control Plan to address the safety of the workers and nearby residents. In the event that action levels are exceeded, the RAC will investigate the source of the particulates and reduce work productivity and/or employ dust-control measures. Appropriate dust-control measures include spraying equipment and excavation faces with a fine water mist and covering excavated areas and materials with polyethylene after excavation activities. A supply of water and means of dispersion (e.g., a water tank and sprayer) will be maintained onsite for immediate dust control, if necessary. The RAC's plan will identify methods for dust control and provisions for work stoppage based on the appropriate dust action levels.

Noise Control Plan

The RAC will provide for noise monitoring to evaluate employee exposure levels and potential impacts to nearby residents. The Noise Control Plan will include provisions for Site monitoring (including methods and frequency), hearing protection for workers, and limited work schedules in the event that excessive noise is anticipated. If specific work types result in unacceptable noise levels (> 85 decibels) at the perimeter of the exclusion zone around the excavations, the RAC will make provisions for installing noise control measures and/or using alternate equipment or work procedures.

Stormwater Management Plan

To the extent possible, the RAC will make all appropriate provisions to minimize the volume of water accumulating in disturbed areas (i.e., open excavation areas, stockpile areas) containing impacted soils. The RAC will prepare a Stormwater Management Plan that (1) describes the means and methods that will be used to minimize the accumulation of stormwater in these areas, and (2) identifies the requirements and procedures for sampling and disposing of water contacting impacted soils. The plan will address coordination of disposal with the publicly owned treatment works or other permitted facility and will provide procedures that will ensure that all water discharged meets all applicable standards and requirements. Water that does not come into direct contact with disturbed soil can be rerouted and directly discharged into the appropriate drainage feature.

Excavation Equipment Decontamination Plan

The RAC will prepare a decontamination plan that describes the measures to be used to remove impacted materials from excavation equipment prior to leaving the exclusion zone. Portions of the excavation equipment and transport vehicles that come into

contact with impacted soil will be decontaminated prior to leaving the Site or relocated to an area that does not contain elevated concentrations of arsenic and/or lead. Decontamination wastes will be combined with other materials being excavated from the Site and will be transported to a RCRA Subtitle D landfill.

Site Security Plan

The RAC will prepare a Site Security Plan that describes the measures to be used to safeguard equipment and prevent unauthorized access to open excavation areas and other work areas during the removal action. At a minimum, Site security includes 24-hour surveillance and restrictive barriers around all open excavation areas and other areas where hazards may be present.

Contingency Plan

The RAC will prepare a Contingency Plan that includes, at a minimum, the following items:

- Spill Prevention Control and Countermeasures Plan for all materials brought to the work area;
- emergency vehicular access/egress;
- emergency action/evacuation procedures of personnel from the work area;
- listing of all contact personnel with phone numbers, including EMES; the RAC; the Engineer; fire officials; ambulance service; local, county, and State Police; and local hospitals, including routes to local hospitals and procedures for notifying each;
- listing of all contact personnel with phone numbers for the owners of above- and below-ground utilities who are to be contacted in case of damage to any utilities; and
- identification of responsible personnel who will be in a position at all times to receive incoming phone calls and to dispatch contractor personnel and equipment in the event of an emergency situation.

Project Schedule

A Project Schedule will be prepared that includes all elements of the removal action. Work may be conducted Monday to Friday between 8:00 a.m. and 5:00 p.m. Additional requirements include:

- horizontal bar chart (Gantt) with separate lines for each section of work, identifying the first work day of each week;
- at a minimum, the following work items:
 - mobilization;
 - site preparation;
 - excavation activities;
 - restoration activities;
 - demobilization; and
- revision and submittal of a construction progress schedule on a weekly basis.

5.3.10.2 Health and Safety Plan

The RAC will prepare, submit, and implement a site-specific HASP that, at a minimum, meets the requirements of 29 CFR 1910 and 29 CFR 1926 (which includes 29 CFR 1926.65) and any applicable state regulations. The HASP will be prepared by a Certified Industrial Hygienist and cover all personnel who will be employed by the RAC to perform work at the Site, including direct employees and subcontractors.

For work involving the potential for contact with or exposure to arsenic- and/or lead-containing soils, the HASP will comply with 29 CFR 1910, 29 CFR 1926, 40 CFR 260-267, and related regulations that call for the development and implementation of a safety and health program for employees involved in hazardous waste operations.

The HASP will be prepared in accordance with 40 CFR 1910.120 and 29 CFR 1926.65 and will address, at a minimum, the following components:

1. Identification of Key Personnel – Identify, by name and by title, the on- and offsite health and safety personnel responsible for the implementation of health and safety procedures. All onsite personnel involved in the measures must have Occupational Safety and Health Administration (OSHA) 40-hour Hazardous Waste Training (29 CFR 1910.120 and 1926.65) and the corresponding 8-hour refresher course update. In addition, all onsite personnel must have completed the initial Loss Prevention System™ safety training program required by EMES.
2. Training – Describe and provide certification of all supervisory and onsite personnel having received appropriate health and safety training. Training requirements will also include attending an initial work-area orientation before

engaging in any onsite activities. Sign-off sheets acknowledging attendance will be provided.

3. Medical Surveillance – Certify that all supervisory and onsite personnel have received appropriate medical examinations and are able to conduct the tasks required for this project, including, but not limited to, working with chemicals, using respiratory protection, using PPE, and conducting hazardous waste operations in accordance with 29 CFR 1910.120 and 1926.65. Medical monitoring may also include additional clearances as required by EMES.
4. Task-Specific Hazard/Risk Analysis – Identify and provide a means of mitigating all foreseeable biological, chemical, and physical hazards associated with the work, including, but not limited to, hazards associated with exposure to contaminants of concern, heavy equipment operation, work area conditions, weather, biological hazards, materials handling, and work around excavated areas.
5. Work Zones – Provide a work area plan that depicts the designation of zones including: (1) Exclusion Zones; (2) Decontamination Zones; and (3) Support Zones. The level of personal protection for each zone must be included.
6. Personal Safety Equipment and Protective Clothing – Identify personal safety equipment and protective clothing to be used and available onsite. This will include the identification of expected levels of protection (A, B, C, D) for each task, and the action levels for PPE upgrades. A respiratory protection program that meets the requirements of 29 CFR 1910.134 and establishes specific requirements for any respirator use will be included.
7. Personal Air Monitoring – Identify protocols and criteria associated with personal air monitoring of onsite personnel.
8. Personnel Decontamination – Describe methods and procedures to be used for decontamination of site personnel and management of PPE.
9. Material Safety Data Sheets (MSDSs) – Provide MSDSs for all materials to be brought to the work area and constituents that are expected to be encountered in the course of implementation of the removal action.

10. Construction Safety Procedures (OSHA 1926.1 – 1926.652, Subpart A-P) – Provide procedures to address excavation and trenching safety procedures, as well as a daily work area safety inspection checklist to evaluate these items.
11. Standard Operating Procedures and Safety Programs – Provide those required by applicable sections of 29 CFR 1910 and 1926.

Determination of the appropriate level of worker safety equipment, procedures, or modification to equipment and procedures based on work-area conditions will be made by the RAC as a result of work-area visit(s), review of available information, and anticipated work area activities.

5.3.11 Site Restoration

Upon completion of the excavation activities and receipt of acceptable confirmation sample analytical results, the Site will be restored as closely as possible to the pre-excavation conditions, or in an alternate manner that is agreeable to EMES and the affected property owners.

In general, excavation in vegetated areas will be backfilled and compacted within 6 inches of existing grade. The remaining 6 inches will be backfilled with topsoil to support vegetation or ground cover. The excavation area in non-vegetated areas will be backfilled and compacted within 6 inches of existing grade followed by placement of 6 inches of crusher run stone. The fill materials proposed by the RAC for site restoration will be analyzed for pH, grain size, total organic carbon, TAL metals, Target Compound List (TCL) volatile and semi-volatile organic compounds (VOCs and SVOCs), pesticides, and polychlorinated biphenyls (PCBs). Sources that contain elevated concentrations of any of the aforementioned constituents or significantly different physical characteristics (pH, grain size, total organic carbon) than the existing Site soils will be rejected. Sample analytical results will be submitted to USEPA for review and approval prior to use.

5.4 Reporting

5.4.1 Weekly Reports

Brief written progress reports that describe actions taken will be submitted by EMES to the USEPA OSC on a weekly basis. Each weekly report will:

- describe all significant developments of the preceding 7-day period, including actions performed and any problems encountered;
- describe developments anticipated during the next reporting period, including anticipated problems and a schedule of work to be performed; and
- discuss planned resolutions of past and anticipated future problems.

5.4.2 Final Report

A final report summarizing the actions taken will be submitted to the USEPA for review and approval within 60 days of completion of the removal action. The final report will conform, at a minimum, with the requirements of Section 300.165 ("OSC Reports") of the National Contingency Plan and will include the following:

- a listing of the quantities and types of materials removed from the Site;
- discussion of the removal and disposal options considered for removed materials;
- a listing of the ultimate destinations of all removed materials;
- a presentation of the analytical results of all sampling and analyses performed; and
- appendices containing all relevant documentation generated during the removal action (e.g., manifests, permits).

The final report will also include the following certification signed by a person who supervised or directed the preparation of the report:

"Under penalty of law, I certify that, to the best of my knowledge, after appropriate inquiries of all relevant persons involved in the preparation of the report, the information submitted is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

5.5 Institutional Controls

Institutional controls will be implemented for the Site following completion of the removal action. While specific language has not yet been developed, it is expected that the following issues will likely be addressed in the institutional controls:

- a description of the post-removal action Site conditions;
- reference to the Site Delineation Report/RAWP and the Project Removal Action Summary Report; and
- notification that post-removal Site conditions may result in the need for implementation of additional safety procedures during future subsurface construction activities.

5.6 Schedule

It is expected that the activities outlined herein will be completed within approximately 345 days, based on the following task durations.

- | | |
|--|---------|
| • Obtain USEPA approval of this RAWP | 30 days |
| • Obtain Access Agreements from Property Owners | 45 days |
| • Prepare Bid Specifications/Select RAC/Prepare RAC Submittals | 60 days |
| • Obtain USEPA approval of RAC Submittals | 30 days |
| • Conduct Removal Action | 90 days |
| • Prepare/Submit Removal Action Summary Report | 60 days |

The project schedule is dependent, in part, on securing the necessary access agreements from property owners and the RAC's schedule, which will be included in the Site Operations Plan. Other potential issues that could lead to project delays include, but are not limited to, the requisition of necessary permits.

Monitoring Well Construction Log

Date Start/Finish: 9-27-06 / 9-29-06

Drilling Company: EEI, Inc.

Driller's Name: Eddie Fuller

Drilling Method: Hollow Stem Auger

Bit Size: NA

Auger Size: 4.25-inch I.D.

Rig Type: CME

Sampling Method: 24-inch splitspoon

Northing: 1367516.585

Easting: 2246227.465

Casing Elevation: 1010.90 ft amsl

Borehole Depth: 30.0 ft bgs

Surface Elevation: 1011.40 ft amsl

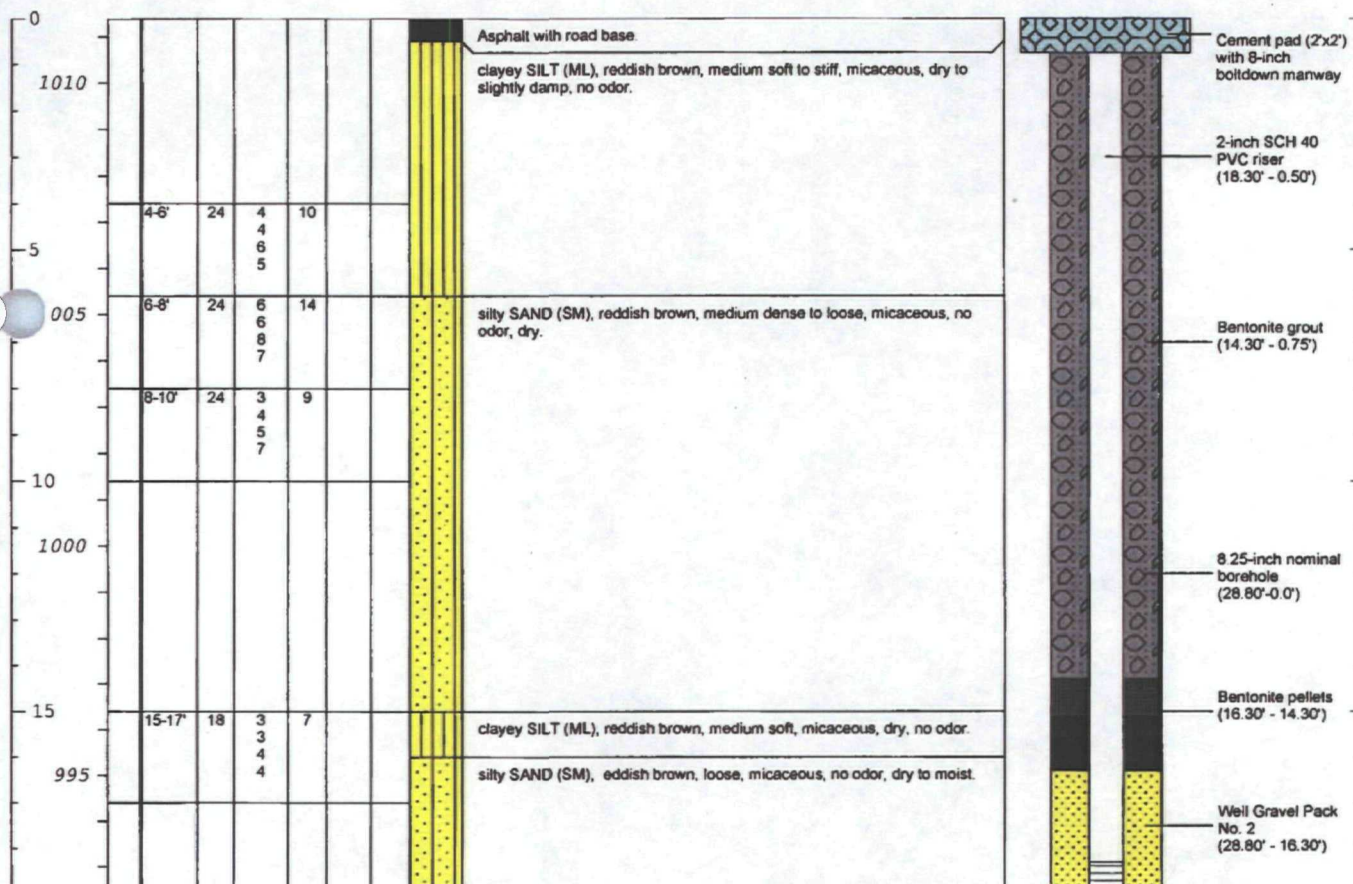

Logged by: Mark Davidson

Well/Boring ID: ATL-MW-01

Client: Exxon Mobil Corporation

Location: VCC- Atlanta
DeKalb County, GA

DEPTH	ELEVATION	SPT Interval (ft bgs)	Recovery (inches)	Blow Counts	N-Value	Geologic Column	Stratigraphic Description	Well/Boring Construction
-------	-----------	-----------------------	-------------------	-------------	---------	-----------------	---------------------------	--------------------------

BBL
BLASLAND, BOUCK & LEE, INC.
engineers, scientists, economists

Remarks:
NA: Not Applicable.
ft bgs: feet below ground surface.
ft btoe: feet below top of casing.
ft amsl: feet above mean sea level.
